Helix Linear Technologies, Inc., Beachwood, Ohio USA

## Company

Helix Linear Technologies is a global supplier in the medical device, life science, security, semiconductor, aerospace, electromechanical, and defense industries. Leading the linear motion industry by manufacturing the highest quality linear actuation solutions in the world, we focus on helping our customers be productive and profitable. Our innovative product design solves real-world linear motion issues and builds a foundation for long term success.

## Culture

Our culture is rooted in teamwork and consists of smart, happy, and competitive professionals focused on manufacturing innovative products and delivering precise electromechanical linear motion solutions. We are in the people business, as well as the product business. Our talented employees make and sell our products, and our extraordinary scope of teamwork keeps our company healthy.

## History

Helix Linear Technologies was founded in 2011 to meet the demand for high-quality lead screws in the growing electromechanical actuation industry. Our rapid growth has included the addition of end-to-end linear actuator solutions, providing integrated solutions.

### Introduction

Lead screws are the most commonly used drivers of linear motion systems. They consist of a threaded shaft (screw) and an internally threaded nut.

### Building a screw assembly

The selection of the correct lead screw and nut for an application involves four interrelated factors. Before attempting to determine the lead screw and nut combination, the following values must be known:

- Axial load
- Speed
- Length
- End fixity type *(see page 19)*

### Speed

The linear speed (or travel rate) is calculated by the lead of the screw, multiplied by the rotations per minute of the screw or nut.

### Length

The unsupported length of the screw.

### Torque

The required motor torque to drive a lead screw assembly is the sum of three components: inertial torque, drag torque, and torque-to-move load. It must be noted that this is the torque necessary to drive the lead screw assembly alone. Additional torque when driving frictional bearings, motor shafts, moving components and drag due to general assembly misalignment must also be considered.

#### Inertial Torque

$$T_j = I\alpha$$

Where:  
 I = screw inertia  
 α = angular acceleration

**Drag Torque:** Helix anti-backlash assemblies are typically supplied with drag torque of 1 to 7 oz.-in. The magnitude of the drag torque is dependent on the standard factory settings or settings specified by the customer. Generally, the higher the preset force the higher the drag torque.

#### Torque-To-Move Load

$$T_L = \frac{\text{Load} \times \text{Lead}}{2\pi \times \text{Efficiency}}$$

Screw diameter		Screw inertia	
in	mm	oz-in-sec <sup>2</sup> /in	g-cm <sup>2</sup> /cm
.078	2	4.29×10 <sup>-08</sup>	1.26×10 <sup>-03</sup>
.125	3.2	2.83×10 <sup>-07</sup>	6.36×10 <sup>-03</sup>
.188	4.8	1.45×10 <sup>-06</sup>	2.01×10 <sup>-02</sup>
.220	5.5	2.67×10 <sup>-06</sup>	4.93×10 <sup>-02</sup>
.250	6.4	4.53×10 <sup>-06</sup>	0.10
.313	8.0	1.11×10 <sup>-05</sup>	0.32
.375	9.5	2.29×10 <sup>-05</sup>	0.79
.438	11.1	4.26×10 <sup>-05</sup>	1.15
.500	12.7	7.24×10 <sup>-05</sup>	2.24
.563	14.3	1.16×10 <sup>-04</sup>	3.02
.625	15.9	1.77×10 <sup>-04</sup>	5.15
.688	17.5	2.60×10 <sup>-04</sup>	8.24
.750	19.1	3.67×10 <sup>-04</sup>	10.24
.875	22.2	6.79×10 <sup>-04</sup>	18.40
1.000	25.4	1.16×10 <sup>-03</sup>	32.69

## Types of Loads

Loads that need to be considered are the static loads, dynamic loads, reaction forces, and any external forces affecting the screw.

**Static Load:** The maximum thrust load, including shock, that should be applied to a non-moving nut assembly. Actual maximum static load may be reduced based on end machining and screw mounting hardware.

**Dynamic Load:** The maximum recommended thrust load which should be applied to the lead screw and nut assembly while in motion. Calculated as the load at which the screw-nut pairing will survive  $10^6$  revolutions.

**PV Load:** Any material which carries a sliding load is limited by heat buildup caused by friction. The factors that affect heat generation rate in an application are the pressure on the nut in pounds per square inch of contact area and the surface velocity in feet per minute at the major diameter. The product of these factors provides a measure of the severity of an application.

**Tension Load:** A load that tends to “stretch” the screw.

**Compression Load:** A load that tends to “squeeze” the screw.

**Thrust Load:** A load parallel to and concentric with the axis of the screw.

**Overturning Load:** A load that tends to rotate the nut radially around the longitudinal axis of the screw.

**Side Load:** A load that is applied radially to the nut.

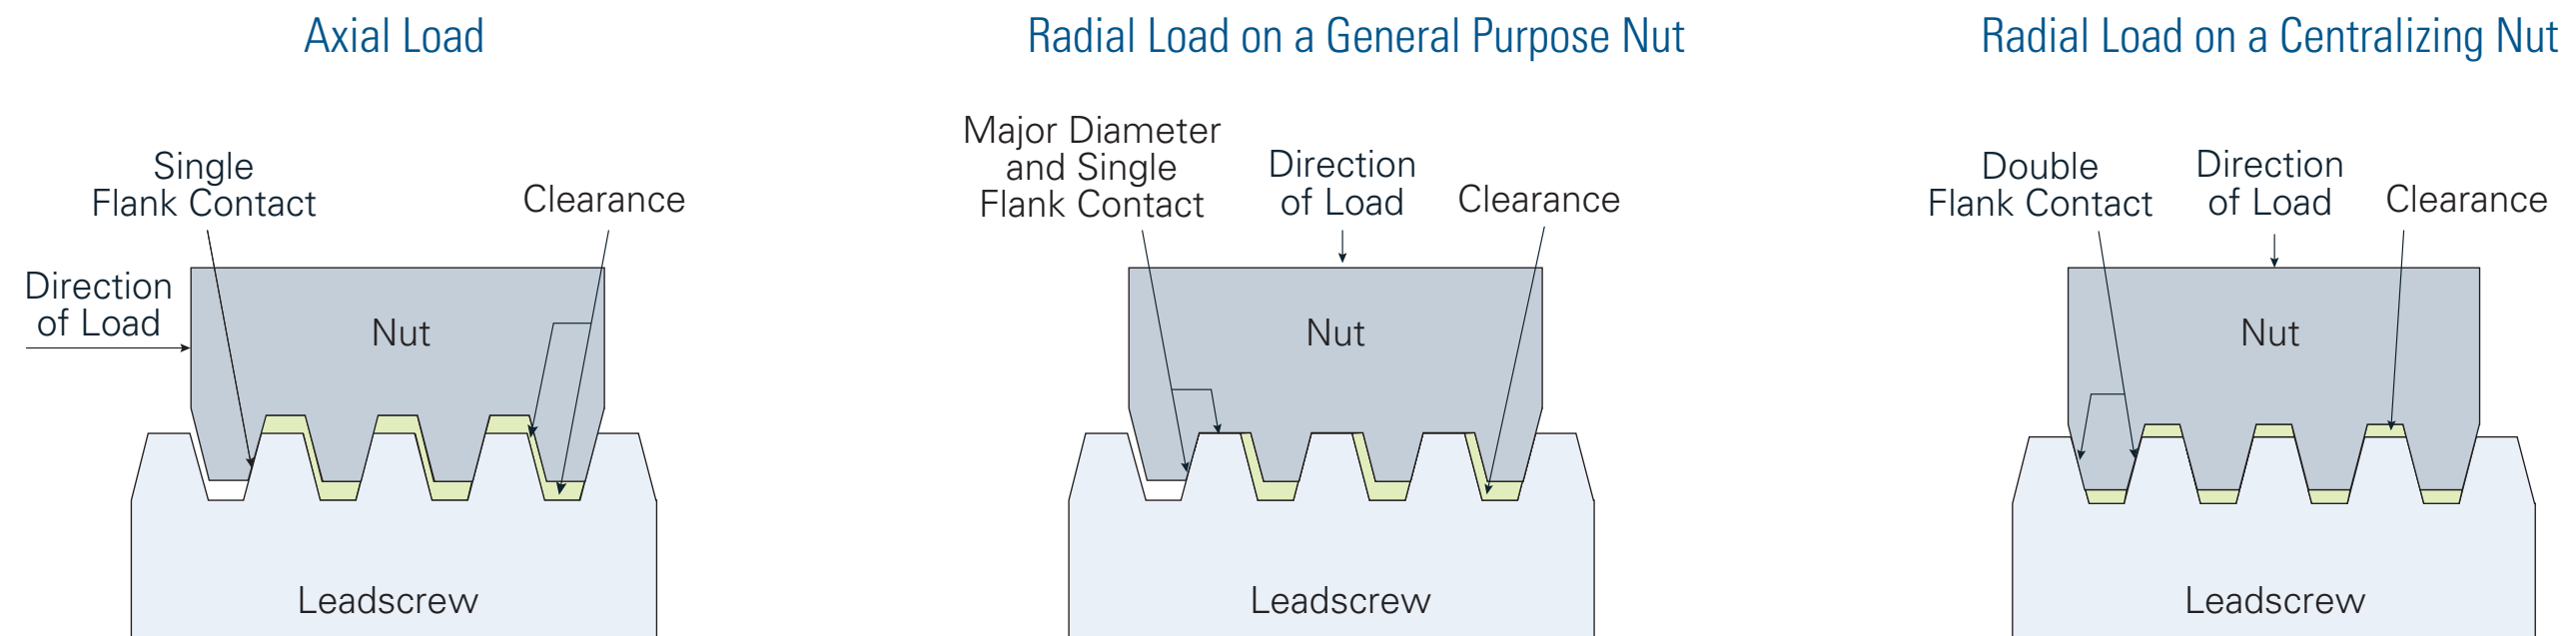

The acme thread form, established over 100 years ago, replaced square thread screws, which had straight-sided flanks and were difficult to manufacture.

There are three main classes of acme thread forms: general purpose (G), centralizing (C), and stub acme. The General Purpose and Centralizing thread forms have a nominal depth of thread of  $0.50 \times \text{pitch}$  and have a  $29^\circ$  included thread angle. Compared to general-purpose thread forms, centralizing threads are manufactured with tighter tolerances and reduced clearance on the major diameter.

Stub acme threads follow the same basic design, but have a thread depth less than one half the pitch.

If an acme nut is side loaded with a radial load, a "G" class will "wedge" when the nut thread flanks come in contact with the screw thread flanks. To prevent wedging, less clearance and tighter tolerances are allowed between the major diameter of the nut and the major diameter of the screw.

**CAUTION:** Although a side load will not cause a centralizing thread to wedge, the nut is not designed to operate with a side load such as a pulley, drive belt, etc.

### Definitions

**Major Diameter:** The outside diameter of the screw. Sometimes called Land Diameter.

**Minor Diameter:** The diameter of the screw measured at the bottom of the thread. Sometimes called Root Diameter.

**Pitch Diameter:** The diameter at which the thread thickness is equal to the space between threads. On a lead screw, this diameter is approximately halfway between the land diameter and the root diameter.

**Pitch:** The axial distance between threads. Pitch is equal to the lead in a single start screw.

**Lead:** The axial distance the nut advances in one evolution of the screw. The lead is equal to the pitch times the number of starts.

$$\text{Lead} = \text{Pitch} \times \text{Starts}$$

**Lead Accuracy:** Lead accuracy is the difference between the actual distance traveled versus the theoretical distance traveled based on lead. For example: a screw with a .500 inch lead and .0003 in/in lead accuracy rotated 24 times, theoretically moves the nut 12 inches (24 revolutions  $\times$  .500 inches per revolution = 12.000 inches of travel). With a lead accuracy of .0003 in/in, actual travel could be from 11.996 to 12.004 inches.

**Screw Starts:** The number of independent threads on the screw shaft; example one, two or four.

**NOTE:** Helix precision lead screw designations reference nominal diameter and lead. For example: 250125 screws advance 0.125" in one revolution and require eight turns for one inch of travel. A 250125 screw has 2 starts and a 0.062" pitch.

$$.062'' \text{ pitch} \times 2 \text{ starts} = .125'' \text{ lead}$$

Single Start

Double Start

Four Start

Helix Linear Technologies manufactures precision lead screws by thread rolling, thread whirling, or thread grinding, featuring centralizing and custom thread forms for smooth, no-wedging performance.

### Thread Rolling

Helix Linear Technologies offers the largest selection of rolled lead screw sizes in the industry. Rolled thread screws are precise, cost effective, and are stocked for quick delivery.

### Thread Grinding

Ground thread screws offer higher lead accuracy for applications where positioning tolerances are extremely critical.

### Thread Whirling

Thread whirling with Helix Linear Technologies results in increased productivity and design flexibility.

Screw Type	Material	Thread Class	Lead Accuracy	Screw Dia.	Screw Lengths	Minimum Hardness	Tensile Strength
Rolled	Alloy	2C or Stub	± .0003 in/in	.125" to 2"		200 Brinell	95,000 psi
	Stainless	2C or Stub	± .0003 in/in	.125" to 1.5"		170 Brinell	85,000 psi
Ground	Alloy	2C, 3C, 3G, 4C, 4G	± .0005 in/ft	.25" to 2"	up to 19"	200 Brinell	95,000 psi
	Stainless	2C, 2G, 3C, 4G	± .0005 in/ft	.25" to 4"	up to 19"	170 Brinell	85,000 psi

**Straightness:** Although Helix precision lead screws are manufactured from straight, cylindrical material, internal stresses may cause the material to bend. When ordering random lengths or cut material without end machining, straightening is recommended. Handling or machining of screws can also cause the material to bend. Before, during and after machining, additional straightening is required. When ordering screws with machined ends from Helix Linear Technologies, the following straightness tolerances can be expected:

Helix precision rolled and milled lead screws are straight within 0.010 inch/foot and will not exceed 0.030 inch in any 6-foot section when shipped from the factory.

Helix precision ground lead screws are straight within 0.001 inch/foot when shipped from the factory. If tighter straightness tolerances are required, contact Helix customer service.

**Life:** Helix precision lead screws are manufactured from high quality materials with excellent dynamic properties. Because of the variable effects of friction, lubrication and cleanliness, a specific life cannot be predicted. Proper lubrication, regular maintenance, and operation within specified limits will extend the life of lead screws.

**Efficiency:** Efficiency of Helix precision lead screw assemblies range from 15% to 85%. These efficiencies are dependent upon nut material, lubrication, lead and thread form. The efficiencies for each assembly are listed on the following pages.

**Back driving:** Normally, lead screws are used to convert rotary motion into linear motion. Back driving is the result of the load pushing axially on the screw or nut to create rotary motion. Generally, a nut with efficiency greater than 50% will have a tendency to back drive. If a self-locking assembly is required, select a nut with efficiency below 35%.

**CAUTION:** Vibration can cause any lead screw assembly to creep or back drive. When using lead screws, applications should be analyzed to determine the necessity of a brake, especially when the possibility of injury may occur.

# Lead Screws

## Critical Speed

Once the load, speed, length and end fixity are identified, the next factor to consider is the critical speed. The speed that excites the natural frequency of the screw is referred to as the critical speed. Resonance at the natural frequency of the screw will occur regardless of the screw orientation (vertical, horizontal etc.) or if the system is designed so the nut rotates about the screw. The critical speed will vary with the diameter, unsupported length, end fixity and rpm. Since critical speed can also be affected by shaft straightness and assembly alignment, it is recommended that the maximum speed be limited to 80% of the calculated critical speed. The theoretical formula to calculate critical speed in rpm is:

$$N = \frac{C_s \times 4.76 \times 10^6 \times d}{L^2}$$

Where:

- N = Critical Speed (rpm)
- d = Root Diameter of Screw (inch)
- L = Length Between Bearing Supports (inch)
- $C_s$  = 0.36 for fixed/free, 1.00 for simple/simple, 1.47 for fixed/simple, 2.23 for fixed/fixed

If the selected lead screw does not meet critical speed criteria, consider the following options:

- Increase screw lead and reduce rpm
- Change end fixity (e.g. simple to fixed)
- Increase screw diameter

**To Use This Chart:** Determine maximum travel rate required. Determine screw length L. Find point at which travel rate and screw length intersect and select a screw above and to the right of that point.

Speed indicated by curves are 80% of theoretical critical speed. See [page 19](#) for reference description on A-B-C-D end fixity.

The specifications and data in this publication are believed to be accurate and reliable. However, it is the responsibility of the product user to determine the suitability of Helix products for a specific application. While defective products will be replaced without charge if promptly returned, no liability is assumed beyond such replacement.

# Lead Screws

## Column Strength

When a screw is loaded in compression (see compression load definition on [page 5](#)), its limit of elastic stability can be exceeded and the screw will fail through bending or buckling. The theoretical formula to calculate the column strength in pounds is:

$$P_{cr} = \frac{14.03 \times 10^6 \times F_c \times d^4}{L^2}$$

Where:

- $P_{cr}$  = Maximum Load (lb.)
- $F_c$  = End Fixity Factor- 0.25 for fixed/free, 1.00 for simple/simple, 2.00 for simple/fixed, 4.00 for fixed/fixed
- $d$  = Minor diameter of screw (in inches)
- $L$  = Distance between nut and load carrying bearing (in inches)

If the selected screw does not meet compression load criteria, consider changing end fixity (e.g. simple to fixed), designing your applications to use the screw in tension, or using a larger diameter screw.

**PV Value:** For plastic nuts, the PV value needs to be checked (see the PV load definition on [page 5](#)). The operating load values for the plastic nuts are based on a pressure of 1,450 lb. per square inch. Any loads less than the operating load can be evaluated by using the following:

$$P = \frac{\text{Actual Operating Load}}{\text{Chart Operating Load}} \times 1,450$$

V is the relative speed between the nut and the screw in feet per minute. V can be calculated by using the following:

$$V = \frac{\text{Major Diameter} \times \pi \times \text{Operating Speed (rpm)}}{12}$$

It is recommended that  $P \times V$  be limited to values less than 2,700.

Table of Contents

Technical Data

Order Now

### Acetal/PTFE blend

The high strength and inherent lubricity of our proprietary plastic nut material can result in product life that can equal or exceed conventional nut materials.

- Tensile Strength @70° F: 8,000 psi
- PV Limit: 12,500 lubricated
- Coefficient of Friction: 0.08 lubricated

### Bronze

Special high tensile bronze is selected for our smooth running, anti-wedging bronze nuts.

- Tensile Yield : 50,000 psi
- Hardness: HB75
- Dynamic Coefficient of Friction: 0.15 with Helix Lubricant

### Delrin AF

A high-performance engineering plastic offering low-friction, chemical resistance, and low moisture absorption

- Tensile Yield : 10,300 psi
- PV Limit : 15,000 psi-ft/min
- Coefficient of Friction: 0.08 lubricated

### Heavy Load Resin

A plastic blend of lubricious & strengthening additives results in a low friction nut with high load capacities.

- Tensile Yield : 10,900 psi
- PV Limit : 40,000 psi-ft/min
- Coefficient of Friction: 0.12 lubricated

## Freewheeling Nuts

Freewheeling nuts are beneficial in motion control applications where the highest precision is not necessary. They have low drag torque because they are designed with clearance between the nut and screw thread, which results in a small amount of lost motion. They therefore may not provide the same level of precision and accuracy as anti-backlash nuts.

## Backlash

Backlash is the relative clearance between a screw and nut without rotation of the screw or nut. Backlash is typically defined as either radial or axial. Radial backlash refers to the clearance between the screw and nut perpendicular to the axis of the screw, whereas axial backlash refers to the clearance between the screw and nut along the axis of the screw. Backlash information for Helix precision lead screws and nuts is listed within the data section of this catalog. Backlash will always increase with use. Helix Linear Technologies has developed several unique ways to reduce or remove the lash between the screw and nut.

Threaded Freewheeling Nut

Flanged Freewheeling Nut

Backlash in a Standard Freewheeling Nut

# Lead Screw Nuts

## Anti-Backlash Nuts

Anti-backlash nuts are ideal for applications that require high precision and accuracy in linear motion. They incorporate a spring-loaded mechanism that minimizes or eliminates backlash, resulting in more accurate and repeatable linear motion. They do however require more maintenance than freewheeling nuts.

Their design compensates for wear over time.

**Axial Anti-Backlash** nuts have different spring options: high force, normal, and micro force. They are easy to manufacture & customize and are good for use with light loads.

**Radial Anti-Backlash** are good for use in vertical and vibration-prone applications. They have lower drag torque than axial style.

**Torsional Anti-Backlash** Nuts are perfect for use in high load, high speed, and low torque applications. They are stiff in compression and are the lowest drag torque option Helix has to offer.

### Compact Torsional Anti-Backlash Nuts

The simplified design of the torsional anti-backlash nut by Helix Linear Technologies gives customers the benefit of high performance with an economic solution. This nut style offers the stiffness of a torsional anti-backlash nut compensation method with minimal added drag due to the preloaded condition of the nut. The nut assembly has fewer components, and therefore custom nut designs can be leveraged such as external nut geometry for mounting, nut body length changes, and even material options as well.

### Heavy Load Nuts

These plastic nuts utilize a blend of lubricious and strengthening additives which result in a low friction nut with high load capacities for the most demanding applications. If a low-friction or a non-lubricated screw assembly is required, even when a metal nut is not usable, the heavy load nut can offer a solution for special application requirements.

### Sleeve Nuts

With a simple and cylindrical nut body, sleeve nuts can be altered to fit into mating components with ease. The round body makes them easy to hold for post-processing. Given its simplicity, the option to use different materials or to change lengths and outer diameters can be achieved with little economic or logistical impact.

### PowerAc™ Acme Nuts

PowerAc Acme nuts use a centralizing type C thread form which reduces wedging, preventing the nut from locking up under load. Compared to standard type G nuts, PowerAc nuts have tighter thread tolerances and reduced clearance on the major diameter.

## Trunnion Mounting Nuts

The trunnion style nut can be used to allow a pivot point about the nut body, or an anti-rotation via mating components, in order to eliminate extra components in the screw assembly. The high strength internal threads along with the square nut body and bosses on either side of the nut make the trunnion nut versatile for wide variety of applications.

## Ball Nut Replacement Nut

When a ball screw assembly is being replaced by a lead screw the ball nut replacer option can be a drop in replacement to mount directly to existing mating components. The lead of the assemblies is also manufactured to match existing ball screw assemblies as well so driving the assembly does not require significant program changes.

## Hurricane Nuts

These patented plastic nuts offer a combination of materials which offer the lowest coefficient of friction possible. The over-molded helix threaded insert provides low friction without compensating the structural integrity of the standard plastic nut.

# Lead Screw Nuts

## Anti-Backlash Life and Traverse Speed

### Anti-Backlash Life

Style	without H10X PTFE Coating		with H10X PTFE Coating	
	in	cm	in	cm
Axial	20-50M	50-130M	50-100M	130-250M
Radial	40M-60M	100M-150M	150-200M	250-315M
Compact Torsional	80-100M	200-250M	180-230M	450-580M
Torsional	100-125M	250-315M	200-250M	500-635M

Anti-backlash life is defined as the nut's ability to compensate for wear while maintaining its zero backlash properties. The above life data is based on 30% of dynamic load rating. Life will vary with loading, operating environment and duty cycle. The longer screw leads generally provide longer life.

### Traverse Speed

The nut materials we use offer long wear-life for a wide variety of conditions. However, very high loads and/or speeds can accelerate nut wear. Special materials may be required for these situations. We offer the following guidelines for continuous duty linear traversing speeds for optimum life:

Lead		Traverse Speed	
in	mm	in/sec	mm/sec
.1-.5	1-12	4	100
.5-1.0	12-25	10	250
1.0- 2.5	25-60	30	760

### EZZE-Mount™

EZZE-Mount bearing blocks contain precision anti-friction bearings and are designed to be used with all screw types. Mount and flange versions of EZZE-Mount bearing blocks are available in both single and double bearing bases.

For data and design specifications, consult the Lead Screw Assemblies section of this catalog on [pages 64 -78](#).

Universal Double Bearing Mount  
Fixed

Flanged Double Bearing Mount  
Fixed

Universal Single Bearing Mount  
Simple

Flanged Single Bearing Mount  
Simple

### End Fixity

End fixity refers to the method by which the ends of the screw are supported. The degree of end fixity is related to the amount of restraint of the ends of the screw. The three basic types of end fixity are:

### Three basic types of end fixity

**Free** No support

**Simple** Restrained against radial and/or axial loads

**Fixed** Shaft rigidly restrained against radial, axial and moment loads

These can be configured in four different ways:

**Fixed/Free**

**Simple/Simple**

**Fixed/Simple**

**Fixed/Fixed**

*Multiple or Spaced Pairs of bearings are more rigid than a Simple support, but because of their compliance are not truly Fixed.*

## End Machining

We offer four types of standard end machining on a lead screw:

Use:

- Type 1 for single bearing mounts
- Type 2 for double bearing mounts
- Type 3 for multiple sets of double bearing mounts
- Type 4 for pillow block mounts

Each of the four types can be designed to accommodate a drive method, indicated by the letters K, L, or N.

### Drive method

- K contains shaft extension and keyway for square keys
- L contains shaft extension with no keyway
- N designed for a non-driven support end

Where standard ends do not satisfy the application requirements, special ends may be machined to customer specifications. Please submit a print for a prompt and competitive quotation.

For data and design considerations for end machining options at Helix Linear Technologies, consult the charts on [pages 79-82](#).

## Precision Locknuts

Helix offers precision ground locknuts for extreme applications requiring ground face and precision ground thread with extra thread engagement. These locknuts have a lock washer to ensure secure positioning.

**Locknut Threads:** Locknut threads are machined to allow the bearing retention on the screw shaft by means of a locknut. The thread used on standard machined ends follows American National Form UNS-3A. Precision ground locknuts are available on special order.

**Matched Lead:** When multiple screws are used in unison to move a load with precise synchronicity, screws of similar lead accuracy can be factory selected and supplied as sets. Consult factory for matched lead set tolerances.

**Approval Drawings:** If custom ends or special dimensions are desired, we are happy to create an approval drawing for your review. These drawings will show all the critical dimensions with appropriate tolerance and require customer approval prior to manufacture.

## Mounting and Pinning of Flanges

### For PowerAC™ Acme Nuts

The preferred method of locking a flange to a nut is a pin or set screw parallel to the screw which intersects the flange/nut mounting thread. Because of the dissimilarity of materials, the hole may need to be milled, not drilled.

Alternatively, the flange may be drilled and tapped radially for a set screw. After assembly of the flange to the nut, spot drill the nut threads through the flange and install a dog point set screw from the flange O.D. into the nut O.D. threads. Avoid getting metal chips in the nut when drilling.

Commercially available thread adhesives may be used for light load applications. Follow the manufacturers' recommendations to ensure a satisfactory bond. Avoid getting the adhesive onto the lead screw thread.

Diameter	Description
.25 to .625	.125" × .25" Slotted Spring Pin
.75 to 1.0	#10–24 × .25" Set Screw

## Coefficient of Friction Acetal Nut to Screw

	No Coating	With Helix H10X PTFE Coating
Static	0.15	0.09
Dynamic	0.15	0.08

## Temperature

With proper lubrication, Helix Lead screws with bronze nuts operate efficiently between 15°F and 350°F, and plastic nuts between 15°F and 175°F. A complete lead screw assembly has a standard operating temperature range between 32°F and 200°F (0°C - 93°C)

\*Very high or low temperatures may cause significant changes in the nut fit or drag torque. Please call Helix Linear Technologies for optional temperature range materials.

## Optional Surface Coatings

Consult Helix engineers for specific surface coatings for anti-corrosion and lubrication.

## Lubrication

Proper lubrication must be provided to achieve satisfactory service life. Helix Linear produces both “wet” and dry lubricants for lead screws. Helix PTFE dry coating is excellent for food, medical and semiconductor applications. Helix acme screw lubricant (E-100 spray lube or PAG-1 grease) is recommended for applications using precision lead screws without PTFE coating.

Lubrication intervals are determined by the application. It is required that screw assemblies are lubricated often enough to maintain a film of lubricant on the screw.

## Grease Compatibility Chart

Nut Type	Grease	Lubrication Coatings	
		Helix H10X®	HC1 Ceramic Coating®
Axial	Yes	Yes	Yes
Radial	Yes	Yes	Yes
Compact Torsional	No	Yes	Yes
Torsional	No	Yes	Yes
Freewheeling	Yes	Yes	Yes

## Available Materials

- Carbon Steels
- Alloy Steels
- Alloy Heat Treated Steels
- Stainless Steel, Aluminum
- Titanium, Exotic Metals
- Brass

## Available Diameters

- 0.039" - 2.50"  
(1mm - 63.5mm)

## Available Lengths

- 36", 72", 144" length available from stock
- Custom lengths up to 360"

## Custom Nuts

At Helix, we mold and machine a wide array of lead screw nuts and actuator components from standard polymers such as PEEK, Torlon<sup>®</sup>, Acetal, Polypropylene, Turcite<sup>®</sup>, and custom engineered polymers that incorporate fillers like PTFE, PFPE, silicone, carbon fibers, graphite, glass fibers and molybdenum disulfide. Should cost or design constraints require a more integrated package, our engineering staff can help you simplify your design by combining several different components into a molded nut.

## Custom Screws

At Helix Linear Technologies, we manufacture the most precise lead screws in the world. We have perfected the thread-rolling process over four decades and today offer the widest range of thread rolling capacity globally. We have manufactured hundreds of custom screw diameters and leads for our customers who require a size that is not in our catalog. We are also the experts in thread-rolling non-standard materials and produce screws from titanium, aluminum, high-carbon steel, 300 and 400 series stainless steels, PH grades (17-4, 13-8), plastics and special chemistry alloys.

## Custom Machining

We offer extensive machining services on our lead screws and nuts. Simply e-mail us your sketch, drawing, or 3D model and we will provide a quotation in 24 hours.

- Screws cut to precision lengths
- Annealing
- Straightening
- CNC turning and milling
- Grinding

- Specialty platings

Twin-lead screws offer dual opposing motion using a single drive system. These one-piece high-performance screws are made from either stainless steel or a high alloy steel with a black oxide coating applied for protection. They can be assembled with Helix lead screw nuts and EZZE-Mount™ bearing supports to form cost effective systems.

Twin-lead screws that are stocked for delivery without machined ends can be found on [pages 40-41](#)

Consult the Part Number Configuration Guide on [page 26](#) to complete your part number.

Twin-lead screws can be used in molding machines, packaging equipment, food processing machinery, robotics, material handling equipment, tire manufacturing and assembly applications. To order a twin-lead screw cut to a custom length and/or with machined ends, select a size from the chart below, determine overall length (OAL), LH and RH thread length, nut, and, if required, EZZE-Mount™ bearing support.

# Ordering a Lead Screw Assembly

## Part Number Configuration Guide

**KTA 025062 RA / 1K / 4N / 6.00 / TS**

**Nut Code** \_\_\_\_\_  
See table to the right

**Screw Code** \_\_\_\_\_  
See tables on pages 27-41

**Helix Direction** \_\_\_\_\_  
R = Right Hand Thread  
L = Left Hand Thread

**Material** \_\_\_\_\_  
A = Alloy Steel, Rolled  
S = Stainless Steel, Rolled

**First End Configuration**  
**End Type** \_\_\_\_\_  
Type 1, 2, 3, 4

**Shaft Extension** \_\_\_\_\_  
K = With Keyway  
L = Without Keyway  
N = No Shaft Extension

**Second End Configuration**  
**End Type** \_\_\_\_\_  
Type 1, 2, 3, 4

**Shaft Extension** \_\_\_\_\_  
K = With Keyway  
L = Without Keyway  
N = No Shaft Extension

**Overall Length (OAL)** \_\_\_\_\_  
In inches, to two decimal places. "00" if ordering screw only

**Coating** \_\_\_\_\_  
T = PTFE Coating,  
00 = No coating

**Standard** \_\_\_\_\_  
S = Standard configuration  
F = With Flange (NPA and NPB nuts only)

### Nut Codes

Code	Description
NTA	Standard Freewheeling Threaded
NFA	Standard Freewheeling Flanged
ATA	Axial Anti-Backlash Threaded
AFA	Axial Anti-Backlash Flanged
RTA	Radial Anti-Backlash Threaded
RFA	Radial Anti-Backlash Flanged
KTA	Torsional Anti-Backlash Threaded
KFA	Torsional Anti-Backlash Flanged
GTD	Compact Torsional Anti-Backlash Threaded
GFD	Compact Torsional Anti-Backlash Flanged
BNR	Ball Nut Replacement
TMA	Plastic Trunnion Mounting Nut
TMB	Bronze Trunnion Mounting Nut
HLC	Heavy Load Nut Compact Flanged
HLR	Heavy Load Nut Round Flanged
SNA	Sleeve Nut (GP Acetal)
SNB	Sleeve Nut Bronze
HAFA	Hurricane Axial Anti-Backlash Flanged
HNFA	Hurricane Freewheeling Standard Flanged
NPA	Acme Plastic Threaded
NPB	Acme Bronze Threaded

## FIRST END CONFIGURATION

**Note:** Both Ends must be specified.

Single Bearing Supports are used in conjunction with Type 1N end machining.

Double Bearing Supports are used in conjunction with Type 3K, 3L, or 3N end machining.

Flanged Fixed Bearing Mounts are used in conjunction with Type 5 end machining.

## SECOND END CONFIGURATION

Refer to the First End Configuration section

**Note:** Both Ends must be specified.

### EZZE-MOUNT™ End Machining

- 1 = Type 1      3 = Type 3  
2 = Type 2      4 = Type 4  
5 = Type 5

**B** = Universal Double Bearing Support  
End Cap Facing Screw Thread

**C** = Universal Single Bearing Support

**D** = Flanged Single Bearing Support  
Flange Facing Screw Thread

**E** = Universal Double Bearing Support End  
Cap Facing Away From Screw Thread

**F** = Flanged Double Bearing Support  
Flange Facing Screw Thread

**G** = Flanged Single Bearing Support Flange  
Facing Away From Screw Thread

**H** = Flanged Double Bearing Support Flange  
Facing Away From Screw Thread

**R** = Flanged Fixed Bearing Support Flange  
Facing Screw Thread

**EK** EK = Universal Double Bearing  
Support, with Keyway

### Shaft Extension

**N** = No Shaft

**Q** = Handwheel

**K** = Shaft Extension with Keyway

**L** = Shaft Extension without Keyway

**U** = Universal Double Bearing  
Support with Motor Mount

**V** = Flanged Fixed Bearing Support  
Flange Facing Away From  
Screw Thread

**Y** = Flanged Double Bearing  
Support with Motor Mount

**00** = No End Machining (Screw will be cut to desired length).

**XX** = Custom Machining (Print or specified data must be provided)

# EZZE-Mount™

## Universal Bearing Support with Motor Mount

Our Universal Bearing Support with Motor Mount includes an EZZE-Mount block with a motor mount for easy, accurate installation of lead screw assemblies. Contact sales to configure your lead screw assembly application with a motor mount.

**Note:** When selecting the bearing support for an application with high axial loads, the capacities of the bearings and locknuts must be considered.

Our Universal Double-Bearing with Flange Motor Mount includes an EZZE-Mount block with a motor mount for easy, accurate installation of lead screw assemblies. Contact sales to configure your lead screw assembly application with a motor mount.

**Note:** When selecting the bearing support for an application with high axial loads, the capacities of the bearings and locknuts must be considered.
